COMPANY OVERVIEW

New assets. Higher throughput. Engineered uptime.

SUPERFAST is an Indonesian offshore dry-bulk transshipment company established to raise the operating benchmark for offshore coal transfer. We deploy new-generation floating cranes and loading facilities configured for high sustained loading rates, high mechanical availability and controlled ship-to-ship execution. Each asset is supported by an integrated marine, technical and HSE operating system designed to protect cargo flow and schedule integrity.

The operational gap

Much of the existing offshore transshipment fleet is aging, increasingly maintenance-intensive and unable to sustain the loading performance required by today's coal supply chains. Low net loading rates, unplanned equipment stoppages and inconsistent barge continuity extend ocean-going vessel turnaround and increase demurrage, production and delivery risk. SUPERFAST closes this performance gap with newer assets, disciplined operations and a reliability-led technical platform.

Our operating advantage

- Higher sustained net loading rates to shorten ocean-going vessel turnaround and improve cargo-flow velocity.
- High equipment availability engineered through proven machinery, CMMS-controlled maintenance, condition monitoring and critical-spares readiness.
- Safety-led offshore execution governed by approved SOPs, task risk controls, competent crews and clearly defined operating limits.
- Competitive cost per tonne created through throughput, uptime and predictable execution—never through shortcuts in safety or asset integrity.

MISSION AND PROMISE

Preferred for performance. Trusted for execution.

Our mission

To become the preferred offshore transshipment partner for Indonesia's bulk commodity sector by combining high-productivity loading assets with disciplined marine operations, uncompromising safety governance and a comprehensive technical ecosystem that delivers superior reliability and availability.

Our operating promise

SAFE Execute every transfer under approved procedures, defined operating limits and disciplined HSE controls.

TRUSTED Protect every cargo commitment through reliable assets, transparent reporting and delivery against agreed performance parameters.

SWIFT Convert high net loading rates and equipment availability into shorter vessel turnaround and a more competitive cost per tonne.

SUPERFAST is built as a scalable transshipment platform. Fleet deployment, marine operations, technical management, crewing, maintenance planning, spares support and performance reporting are aligned to one commercial objective: sustain cargo flow, minimise avoidable stoppages and load every vessel safely within the agreed operating window.

FLEET PLATFORM

High-capacity assets for sustained cargo flow

Our fleet programme combines heavy-duty crane and grab systems selected for continuous offshore bulk handling. Two MacGregor-equipped floating cranes form the initial 40,000 mtpd platform. The planned addition of two E-Crane units adds 60,000 mtpd, creating a scalable fleet with target aggregate capacity of up to 100,000 mtpd under suitable cargo, marine and barge-supply conditions.

Fleet phase	Units	Crane / grab system	Nominal loading rate	Combined capacity
Initial delivery	2 FC	MacGregor K5036 / Nemag clamshell	20,000 mtpd each	40,000 mtpd
Planned expansion	2 FC	E-Crane 4000C EC28421 / J&B grab	30,000 mtpd each	60,000 mtpd
Planned fleet	4 FC	Integrated multi-technology fleet	—	Up to 100,000 mtpd

Loading figures are target operating capacities, not guaranteed net rates. Actual performance depends on coal characteristics, grab fill factor, hatch and vessel configuration, barge presentation and continuity, weather and sea state, operating restrictions, crew execution and planned or unplanned stoppages.

Transshipment configurations

- Floating Crane (FC): flexible single-grade barge-to-vessel transfer for geared or gearless ocean-going vessels up to Capesize, subject to project and site conditions.
- Floating Shiploader with Crane (FSC): high-volume, single-grade transshipment using crane-fed conveying and controlled shiploading for ocean-going vessels up to Capesize.
- Floating Loading Facility (FLF): high-capacity offshore loading platform capable of receiving multiple barge streams, controlled blending and continuous loading to ocean-going vessels up to Capesize.

RELIABILITY ECOSYSTEM

Mechanical availability is engineered - not assumed

New assets reduce the inherited failure risk of an aging fleet, but equipment age alone does not guarantee uptime. SUPERFAST integrates OEM-proven machinery, competent operators, CMMS discipline, condition monitoring, planned maintenance, critical spares and responsive technical support into one reliability management system.

PROVEN EQUIPMENT

Main propulsion, power generation, crane and grab systems are selected from internationally recognised makers including Caterpillar, E-Crane, MacGregor, Nemaag and Yanmar, providing proven duty performance and established technical support.

PLANNED MAINTENANCE

Technical management is contracted to KraanWerks, supported by more than 68,000 maintenance hours executed over three years. CMMS-controlled inspections, preventive maintenance, condition monitoring and planned component intervention are aligned to running hours, equipment condition and loading commitments.

CRITICAL SPARES

Risk-ranked critical spares, wire ropes, wear components and operating consumables are planned against failure consequence and lead time, reducing logistics delay and protecting return-to-service time.

TECHNICAL RESPONSE

Crane specialists, strategically positioned service personnel, remote diagnostics and field intervention pathways support rapid fault isolation, repair planning and operational recovery.

PERFORMANCE CONTROL

Loading rate, mechanical availability, utilisation, equipment condition and delay attribution are captured and reviewed to drive corrective action, maintenance optimisation and continuous improvement.

The outcome is a fleet platform engineered to maximise mechanical availability, shorten mean time to repair, control maintenance exposure and give customers transparent visibility of loading performance, stoppages and recovery actions.

SAFETY AND EXECUTION

HSE-governed operations protect people and throughput

Offshore transshipment brings together barges, tugs, floating assets and ocean-going vessels in a dynamic marine interface. SUPERFAST treats HSE as a core operating control: protecting life, health, asset integrity, cargo and the environment through strict adherence to national and international standards

Our HSE control framework

- Project-specific marine assurance, HAZID and cargo-transfer risk assessment before mobilisation and start-up.
- Approved SOPs, permit-to-work controls, defined operating limits, bridge-to-bridge communications and stop-work authority.
- Competency-based crew deployment, job safety analysis and task-specific toolbox talks before critical activities.
- Planned inspection and assurance of cranes, grabs, wire ropes, lifting appliances, mooring systems and safety-critical machinery.
- Near-miss, incident/accident and defect reporting linked to root-cause review, corrective action and fleet-wide learning.
- Environmental controls for spill prevention, waste management, dust suppression and cargo containment, aligned with applicable statutory and project requirements.

Operational performance transparency

Customer reporting is structured around the operating metrics that drive voyage economics: tonnes transferred, gross and net loading rate, mechanical availability, utilisation, stoppage attribution, weather downtime, barge waiting, ocean-going vessel waiting, breakdown duration, HSE observations and campaign progress.

OUR PRINCIPLE: Safe, Transparent and Standardised execution is the foundation of repeatable loading performance.

CUSTOMER OUTCOMES

A stronger mine-to-vessel logistics outcome

Shorter vessel turnaround	Higher sustained net loading rates reduce ocean-going vessel time at anchorage and associated demurrage exposure.
Predictable campaign performance	Mechanical availability, barge-flow visibility and disciplined stoppage control improve shipment planning and schedule confidence.
Lower cost per tonne	Higher throughput and fewer unplanned stoppages spread fixed operating cost across more tonnes transferred.
Scalable loading capacity	A multi-asset fleet allows capacity to be matched to committed volumes, shipment peaks and project growth.
Lower execution risk	Newer equipment, HSE-governed operations and a comprehensive technical ecosystem strengthen operational resilience.

Commercial models aligned to cargo commitments

SUPERFAST can support long-term volume commitments, dedicated fleet deployment, seasonal campaigns and supplementary capacity requirements. Commercial structures can be aligned to annual tonnage, cargo characteristics, operating location, service scope, mobilisation window and agreed performance parameters, with clear allocation of marine and logistics interfaces.

PARTNER WITH SUPERFAST

Move more cargo. Protect every sailing window.

Whether the requirement is to replace aging transshipment capacity, raise net loading performance, support a new coal production stream or add resilience to an existing logistics chain, SUPERFAST brings new-generation assets and an operating model focused on safe, reliable and commercially disciplined execution.

Project data required for deployment assessment

- Annual committed tonnage, monthly shipment profile and peak campaign demand
- Coal specification, bulk density, moisture, sizing and handling characteristics
- Transshipment location, bathymetry, anchorage limits and seasonal metocean conditions
- Barge size, parcel size, round-trip cycle and barge-arrival continuity
- Ocean-going vessel mix, hatch configuration, target loading window and demurrage basis
- Required service scope, contract tenure, mobilisation window and performance regime
